

ADDENDUM

300 in One Electronic Project Lab

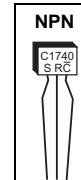

Cat. No. 28-270

There are two different types of transistors in this kit — PNP and NPN. Both types of transistors look exactly the same, except for the lettering on them, so you need to know how to tell them apart before you begin.

Some projects, like “Project 1” on Page 12, use only a PNP transistor. Look for the letter **A** followed by three or four digits (**A933**, for example) marked on the PNP transistor.

Other projects, like “Project 4” on Page 15, use only NPN transistors. Look for the letter **C** followed by three or four digits (**C1740**, for example) marked on each NPN transistor.

Still other projects, like “Project 3” on Page 14, use both types of transistors. Be sure you use the correct transistor where it is needed.
